Nomenclature - Conventions and Terms

Definition of Time Periods

Largey for the sake of convenience, historians have placed markers in history such as early, middle and late, Saxon, Norman, Tudor etc. These markers have been accepted as indications of different periods in time throughout British history.

I apologize to readers from other countries for they will have a different concept of history. All labels, however defined, are arbitrary and their use depends to a great extent upon the subject of study and the context within. I hope I can be forgiven for structuring my thesis in my own cultural context.

The historian Whittock¹ has written about the definition of the period of the Middle Ages and concludes that the usual definition from 1066 to 1485 is based upon analysis of the political events. Analysis of the social structures, however, indicates a different time period entirely. The history of lighthouses includes politics, social history and is also about engineering accomplishments.

My intention from the start of this major work (the study of lighthouses is called **pharology**) is to divide the scope of what I loosely call 'medieval' into three phases - ancient, medieval (middle) and late.

We might once have considered the lighthouses of today as belonging to a 'modern' period, but McCormick wrote his popular "The Modern Book of Lighthouses" in 1936. Now, in the 21st century, with technological advances racing ahead, the word 'modern' is inappropriate. I feel inclined to use the phrase 'lighthouses of the industrial age.' It describes a period that is now historical, for we have left that age far behind. I certainly intend to include the latest technology in volume 3.

As a consequence, for this book my terminology implies that 'late medieval' is almost 'pre-industrial' or perhaps 'pre-modern.'

Whilst the histories of the ancient and medieval periods in some ways blend smoothly into each other, there is a yawning chasm between my own declared 'medieval' and 'industrial' periods. (That is

the reason I chose these dates.) As you make your way through this volume, you may be unaware of the giant steps forward that are described in detail in Volume 3 so there is no more to say here, only that my short essay in Chapter 13 detailing the evolution of structure acts as a bridge to Volume 3 and explains why the break in the story is made at 1700. In reality, it is the changes in light technology and the physics of optics that create the chasm.

The first volume of this trilogy, *Ancient Lighthouses*, concerned their history from earliest times and terminated with the year 400 when the final phase of the Roman Empire approximately began.

In the history of lighthouses, we find that, afterwards, there was a very long period when lighthouses seem to have been largely forgotten about until the start of the industrial period. In lighthouse terms, this began with the building of a wonderful tower on the Eddystone by John Smeaton in 1756 (although the principle was set by Henry Winstanley's structure of 1698).

Having completed my study of lighthouses in Ancient times therefore, I here propose to use the word Medieval in its broadest sense to cover the period from 400 to 1700 which will become my period of study for this book. Within these centuries I shall consider three further sub-divisions.

I will refer to an early Medieval period as the Dark Ages from 400 to 1000. The peak 'middle' period is indicated by the six centuries between 1000 and 1600, and the term pre-modern or pre-industrial to cover the period from 1600 to 1700.

From that time until the turn of the millennium, I shall call the Industrial Period and volume 3 will therefore be titled *Industrial Lighthouses*. These are terms that approximately correspond to conventional practice, but are used here for my convenience only.

Navigational Aids

For consistency, this book will generally refer to navigational aids using the modern definitions given below and described in Figs. N01 and N02. However, so little is known about many of the structures discussed herein that any distinction between them is often very difficult. We note the following definitions:

Beacon: *Any artifact, built or floating, visible or recognizable from a distance, whether by land or sea, that is specifically intended to provide a signal or warning for any purpose not exclusive to navigation.*

Navigational aid: *Any artifact set up, either in the sea or on land, whether built or floating, with the specific purpose, whether primary or otherwise, of assisting seamen in safe navigation. A navigational aid can be lit or unlit and may or may not have an audible signal. When floating, it is always moored in a fixed position.*

Lighthouse: *A fully or partially enclosed built structure bearing a light that is used as a navigational aid and that is capable of admitting at least one person who can operate or maintain the light entirely from within.*

Lightstructure: *A built structure bearing a light that is used as a navigational aid. All lighthouses are lightstructures.*

Functional Analysis

Whilst accepting that the use of lighted aids to navigation may have developed incrementally, it is possible to identify three stages of development:

A waterborne craft steers at night towards a fire or other light that:

- **IS NOT intended to act as an aid to navigation**
(Stage 1);
- **IS intended to act as an aid to navigation**
(Stage 2);
- **IS intended to act as an aid to navigation AND is set on a purposefully-built, elevated platform**
(Stage 3).

Stage 1:

Would have been possible from the times when fire was first used by hominins (today suggested as around 400 ka ago), together with the first use of waterborne craft. It was opportunistic on the part of the navigators and unplanned by those who lit

the fires. This could have been available to any species of *homo* having fire and the capability of using water-borne transport.

Stage 2:

Could have occurred over a long period of transition after Stage 1. The deliberate maintenance of fires provided a guide to homecoming craft. There is a clear distinction between Stages 1 and 2, for Stage 2 requires a purposeful intent that may have been impossible for species of *homo* other than *homo sapiens*, although we cannot rule out its use by Neanderthals. It is therefore likely that Stage 2 was implemented at about the same time or soon after *homo sapiens* began to travel by water. In the English language, this would commonly be referred to as a beacon.

Stage 3:

Is the point at which the idea of a lighthouse finally emerged as a discrete, built, purposeful structure. It seems to have not occurred until a long time after Stage 2, probably in the second millennium BCE.

All of these significant events in human history remain vague and subject to change as new evidence comes to light. In particular, the placement of Stage 3 into the time-line of the figure on p2 is challenging, given the time gap that clearly exists since Stage 2. However, this analysis concludes that the Pharos of Alexandria was the first true lighthouse, rather than simply a Stage 2 lightstructure.

Names of People and Places

A number of civilizations and cultures are covered by the contents of this book and so the names of people and places can vary with context. Likewise, there are many sites that had different names throughout history. Perfect precision requires a level of detail that becomes cumbersome and renders the text clumsy and difficult to read. I have tried to use a common-sense approach that, on the whole, uses the commonest form and gives alternatives where it seems sensible to do so. The site survey of lighthouse and lightstructure sites gives all of the alternatives that I am aware of.

I have used italics for the names of ancient places or terms in non-English languages. Any inconsistency is unintended.

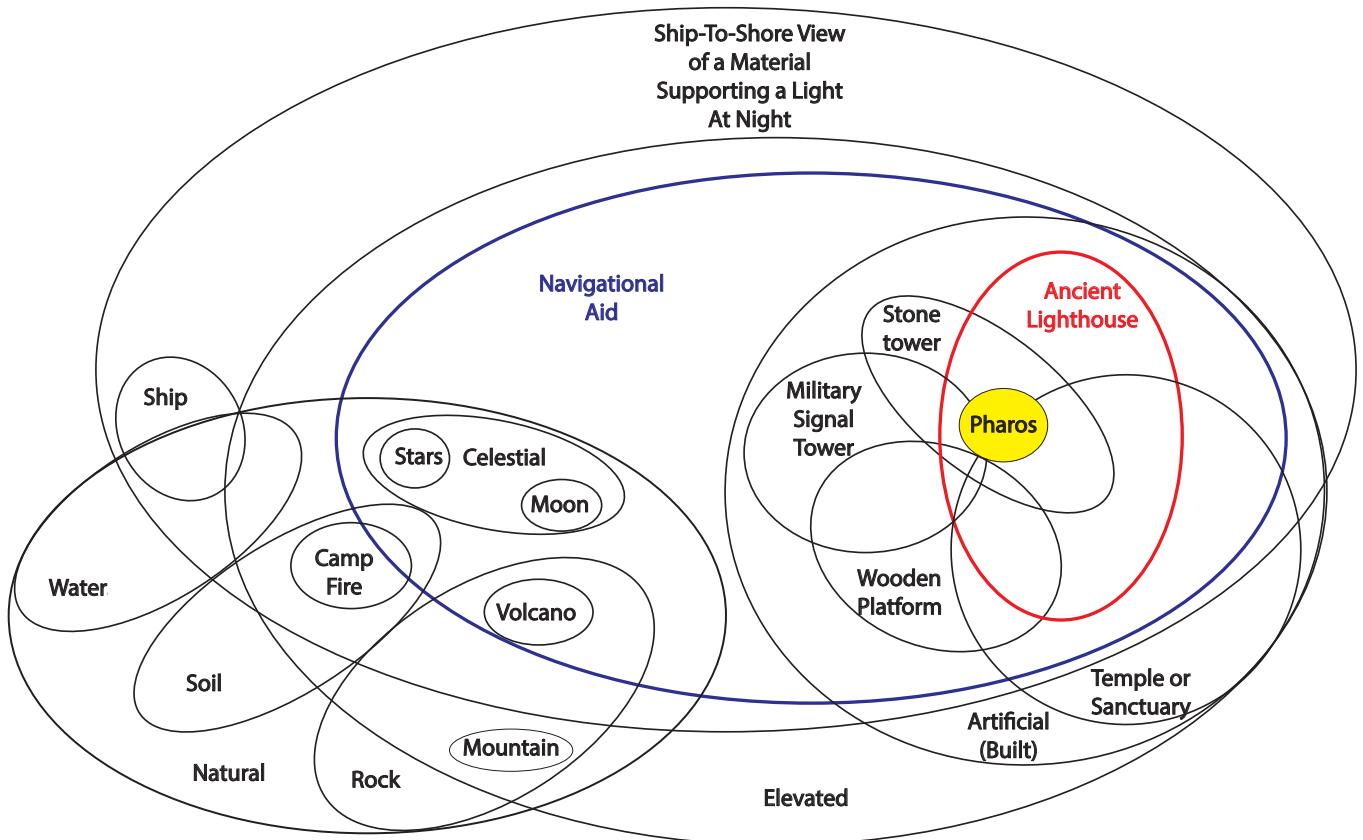

Fig. N01: Ship-To-Shore View at Night. This Venn Diagram illustrates the relevant visual and functional properties of lights viewed at night by mariners as aids to navigation. In particular, the diagram defines the world's first accepted ancient lighthouse.

The diagram applies to night; varying degrees of reflected moonlight have not been included.

Elevated is above ground level on the shore.

Sizes of ellipses and sectors have no significance. Overlap is a visual allusion to shared visual and functional properties.

A volcano is a navigational aid if it is visible at night.

A ship may carry a light but because it moves is not a navigational aid.

A camp or domestic fire can be a navigational aid if it helps a mariner to return to a place from where he departed.

A temple or sanctuary or other altar is by definition elevated and can be considered to be an ancient lighthouse as a secondary function.

The Pharos of Alexandria is the first artificial (built) stone tower that was used as a lighthouse for its primary function. It may also have been used for religious and military purposes, but these were secondary functions.

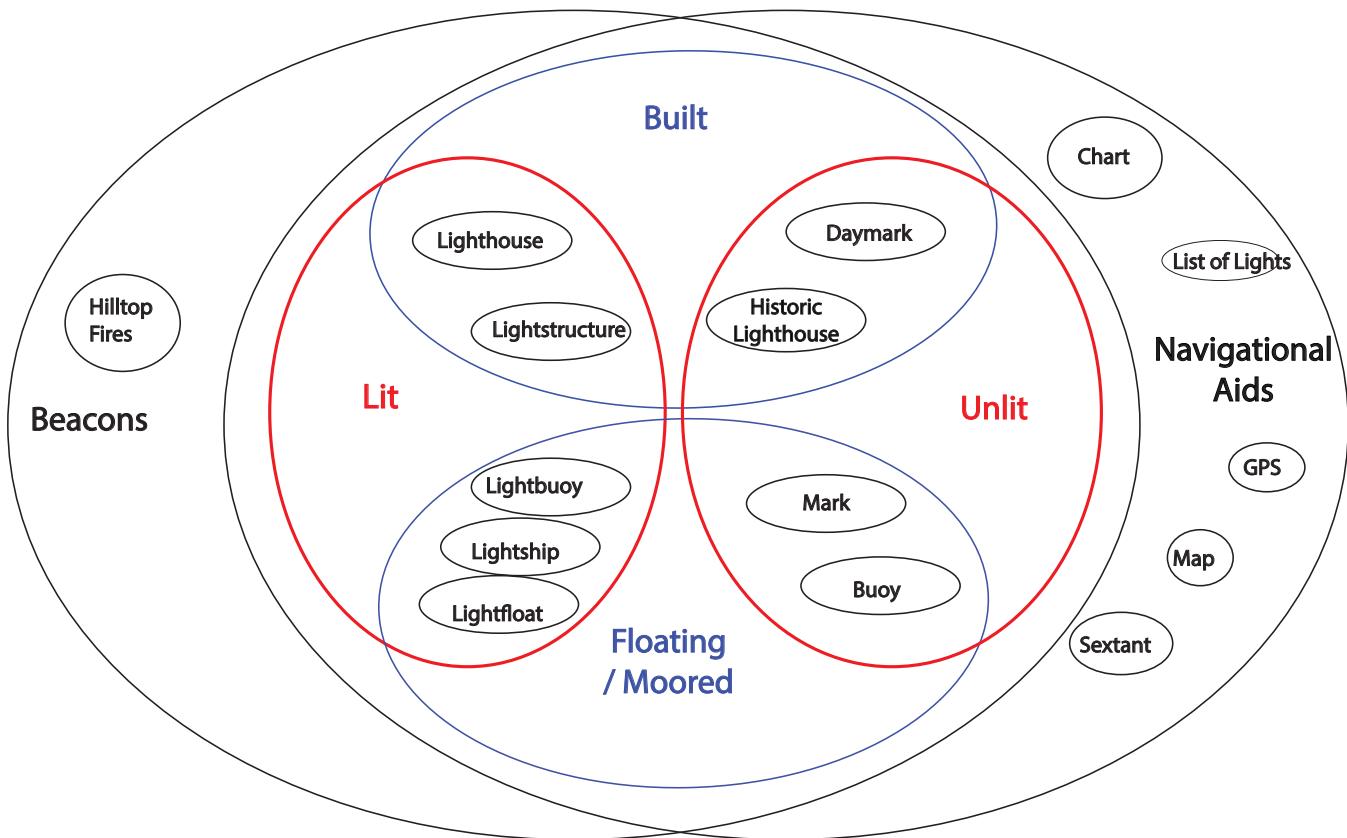

Fig. N02: A Venn Diagram that considers modern navigational aids in terms of their visual properties.

Those structures that are both lit and built are lighthouses and lightstructures.

A historic lighthouse is unlit.

Symbols Used on Maps

Throughout this book I have tried to use the following icons on maps:

 Red pins indicate medieval sites

 Yellow pins indicate modern lightstructure sites, possibly disused.

 Purple pins indicate current lighthouse sites

Different colour balloons represent other features.

Green = Places of Note; Blue = Waterways

Contents
